

Use and Availability of Subcutaneous Injectables in Select Countries

Data from Burkina Faso, Democratic Republic of Congo, Niger, and Uganda
2016-2017

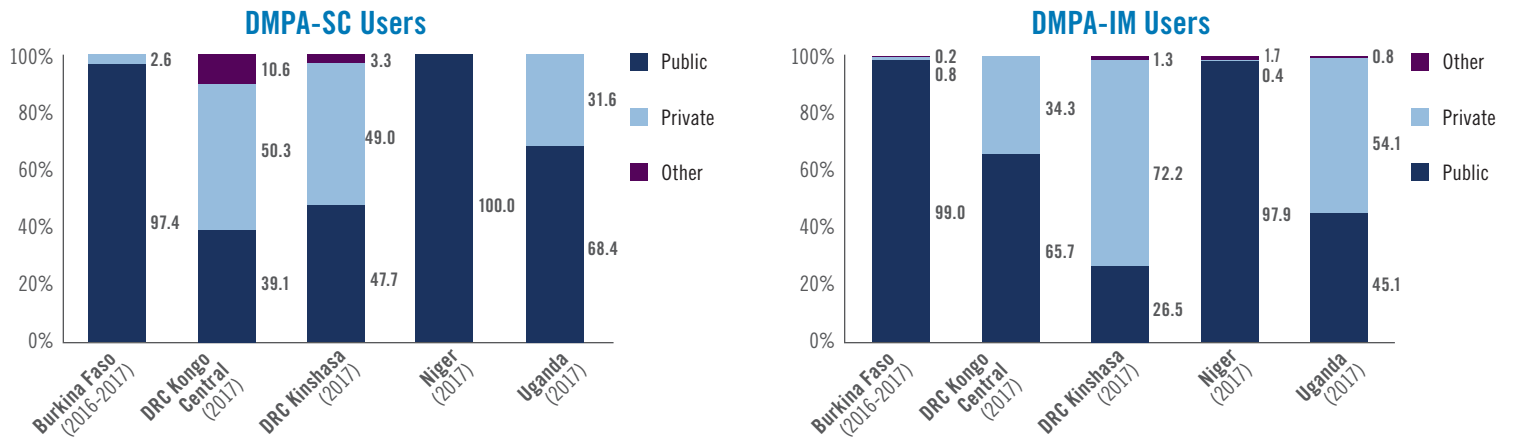

The subcutaneous injectable, or DMPA-SC, is a new type of contraceptive injectable administered under the skin. Unlike traditional injectables administered into the muscle (DMPA-IM), DMPA-SC combines drug and needle into one device (Uniject), making it easier for lower-level health workers to administer.

PMA2020 began collecting data on the availability and use of subcutaneous injectables in 2015.

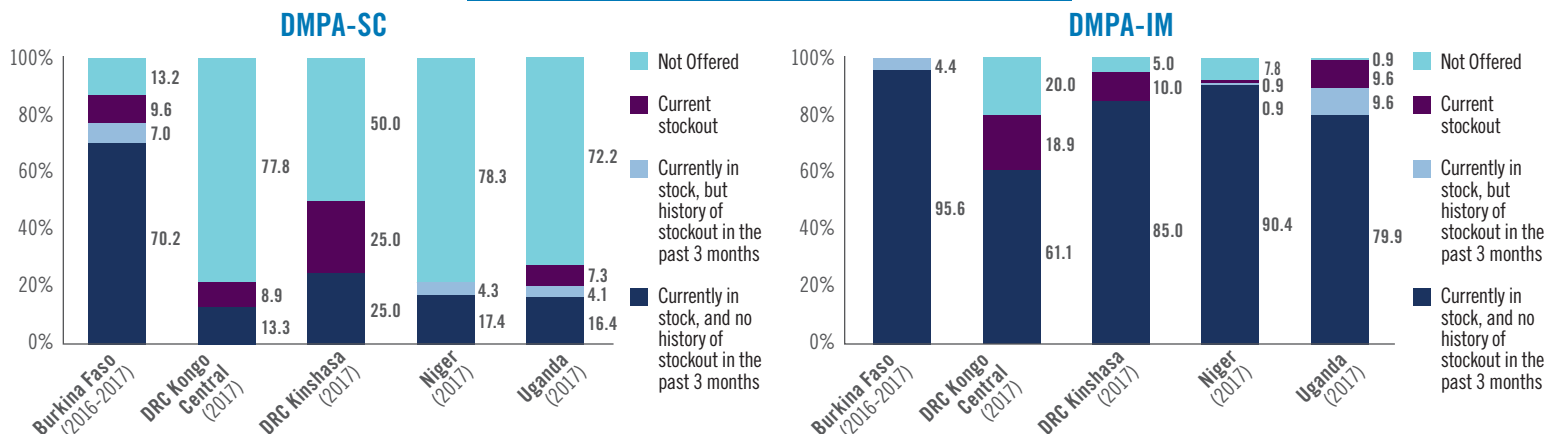

DMPA-SC Share of Method Mix in 5 Geographies

Source of Methods Among All Women Currently Using Injectables

Availability of Injectables Among Public Facilities

Note: SDP samples are representative of facilities serving the population in the study enumeration areas. For further information on sampling methods, please see <https://www.pma2020.org/sampling-overview>
